

iC-WK, iC-WKL 2.4 V CW LASER DIODE DRIVER

Rev D2, Page 1/10

FEATURES

- ◆ iC-WK MSOP8 AEC-Q100 qualified (Grade 3)
- ◆ CW operation up to 90 mA from 2.4 to 6 V supply voltage
- ◆ Rapid soft start after power-on typical within 70 μ s
- ◆ Simple power adjustment via the external resistor
- ◆ Control loop accuracy better than 1% with changes in temperature, supply voltage and load current
- ◆ Integrated reverse polarity protection for the iC and laser diode
- ◆ Strong suppression of transients with very small external capacitors; integrated flyback path
- ◆ Permanent shutdown with excessive temperature and overcurrent (i.e. if the laser diode is damaged or the feedback current path fails)
- ◆ Two feedback inputs permit all current LD types to be used (N/P/M configurations)
- ◆ Modulation via the feedback inputs is possible
- ◆ Wide monitor current range from 10 μ A to 2.5 mA
- ◆ iC-WK with additional spike detection at monitor input MDA

APPLICATIONS

- ◆ Battery-powered LD modules
- ◆ LD Pointers
- ◆ Laser levels
- ◆ Bar-code readers

iC-WK, iC-WKL 2.4 V CW LASER DIODE DRIVER

Rev D2, Page 2/10

DESCRIPTION

The iC-WK/L device is a driver for laser diodes in continuous wave operation which requires only four external components. The wide power supply range of 2.4 to 6 V and the integrated reverse battery protection allow for battery operation with a minimum of two cells. A reversed battery connection destroys neither the iC nor the laser diode.

The iC includes integrated circuitry protecting against destruction by ESD, excessive temperature and overcurrent and a soft start which regulates the power and protects the laser diode when the power supply is switched on. The iC also filters the laser diode power supply for transients.

The power supply is regulated and adapted to the laser diode used by an external resistor at MDA. The monitor current acts as a reference and is regulated independent of the influence of temperature and supply voltage (range: 10 μ A to 2.5 mA). The capacitor at

CI determines the control time constants and start-up time.

A second monitor input, pin MDK, allows the driver to be used for other types of laser diode configuration; alternatively, it can be used as an analogue modulation input (DC to a few kHz).

In the event of failure, such as overcurrent in the laser path with a lack of feedback, for example, a quick power lockout is activated. The shutdown continues until power is reapplied, permitting a restart. The strain on power packs and batteries is relieved and the laser class is retained even in the event of a disturbance.

iC-WK offers additional protection by means of spike detection at pin MDA. Should spikes or oscillation occur at pin MDA the power lockout is activated.

PACKAGING INFORMATION SO8, MSOP8 to JEDEC

PIN CONFIGURATION SO8

PIN CONFIGURATION MSOP8

PIN FUNCTIONS

No.	Name	Function
1	GND	Ground
2	CI	Capacitance for Power Control
3	AGND	Reference Ground for CI, RM
4	MDK	Monitor Input 2 (MD Cathode, Modulation)
5	MDA	APC Setup, Monitor Input 1 (MD Anode)
6	VCC	+2.4 to +6 V Supply Voltage
7	LDA	Laser Supply (LD Anode)
8	LDK	Driver Output (LD Cathode)

Do not short-circuit pins AGND and GND, for this may deteriorate the precision of the regulator and interfere with the soft-start!

ABSOLUTE MAXIMUM RATINGS

No Destruction, correct function not guaranteed.

Item No.	Symbol	Parameter	Conditions			Unit
				Min.	Max.	
G001	VCC	Voltage at VCC		-6	6.5	V
G002	I(VCC)	Current in VCC		-10	95	mA
G003	I(CI)	Current in CI		-10	10	mA
G004	I(LDA)	Current in LDA		-95	10	mA
G005	I(LDK)	Current in LDK		-10	95	mA
G006	I(MDA)	Current in MDA		-10	10	mA
G007	I(MDK)	Current in MDK		-10	10	mA
G008	I(AGND)	Current in AGND		-10	10	mA
G009	I(GND)	Current in GND		-95	10	mA
G010	Vd()	ESD Susceptibility at all pins	HBM, 100 pF discharged over 1.5 kΩ		2	kV
G011	Tj	Operating Junction Temperature		-40	150	°C
G012	Ts	Storage Temperature Range		-40	150	°C

THERMAL DATA

Operating Conditions: VCC = 2.4...6 V

Item No.	Symbol	Parameter	Conditions				Unit
				Min.	Typ.	Max.	
T01	Ta	Operating Ambient Temperature Range		-40		85	°C
T02	Rthja	Thermal Resistance Chip/Ambient	SMD assembly, no additional cooling areas			140	K/W

All voltages are referenced to ground unless otherwise stated.
All currents flowing into the device pins are positive; all currents flowing out of the device pins are negative.

SAFETY INSTRUCTIONS

Laser light can damage the human eye and the eyes of animals! Do not look at any laser light directly or through any optical lens. When handling a laser diode, do not look directly at the light generated by it. Wear appropriate safety glasses to prevent light from entering the eye even by reflection.

TURN-ON/OFF BEHAVIOUR

Turn-on behaviour

After switching on the supply voltage the output stage remains disabled until the internal enabling flip-flop is set by a sufficiently high voltage at LDA.

Figure 1: Turn-on behaviour

A quick soft start occurs during phase I; the control capacitor CI is loaded at an accelerated rate until the output stage supplies current at LDK. An open-circuit voltage at pin MDA is used to verify the external resistance.

Phase II, the initialisation process, begins when current starts to flow at LDK. This phase ends when the laser reaches its threshold current and the monitor current produced raises the potential at resistor RM.

The transition to CW operation (phase III) is gradual and primarily influenced by the CI and RM components. CI is properly dimensioned when the voltage overshoot at MDA is at a minimum.

Turn-off behaviour

iC-WK/L functions without a fixed undervoltage lockout, thus the laser diode forward voltage is the prime factor determining the lowest possible supply voltage.

If the voltage drops below this, the output stage is forcibly saturated and the laser current falls. In this instance iC-WK/L simultaneously discharges control capacitor CI so that no excessive laser diode currents occur when the supply voltage rises again.

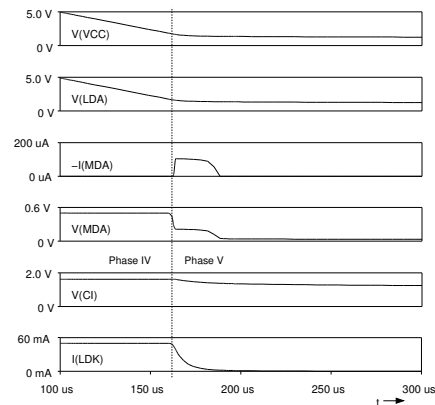

Figure 2: Turn-off behaviour

Disruptions in operation

The power control is shut down with excessive driver temperature or when the laser current reaches the over-current shutdown threshold, for example when the feedback is interrupted. If the monitor diode or the preset resistor RM fail, the device is shutdown in less than 250 μ s, provided that the supply voltage applied is high enough.

When modulating or switching the laser current via pin MDK (see Application Notes), excessive voltage occurring at pin MDA also causes a shut down (iC-WK only).

iC-WK, iC-WKL

2.4 V CW LASER DIODE DRIVER

Rev D2, Page 9/10

APPLICATION NOTES

Setting the output power

The output power is simply set by $RM = V(MDA) / I(MD)$; with $V(MDA) = \text{Item-No. 101}$ and $I(MD) = \text{monitor current at the desired operating point}$. RM should be combined from a fixed resistor (max. output power) and a potentiometer (calibration).

Further application notes on [iC-WK/L](#) and the data sheets of the evaluation modules and the demo board are available as separate documents.
