

Rev C2, Page 1/12

#### FEATURES

- Optimised for M-type laser diodes
   (single supply ease grounded)
  - (single supply, case grounded)
- CW operation up to 350 mA from a single supply of 3.6 to 15 V
- Rapid soft start after power-on
- Simple power adjustment via an external resistor
- Integrated reverse polarity protection for the iC and laser diode
  Strong suppression of transients with small external capacitors;
- integrated flyback path
   Permanent shutdown with excessive temperature and
- overcurrent (i.e. if the laser diode is damaged or the feedback current path fails)
- Two feedback inputs permit all current laser diode types to be used (M/P/N configurations)
- Modulation via the feedback inputs possible
- ♦ Wide monitor current range from 2.5 µA to 6.25 mA

thermal pad

APPLICATIONS

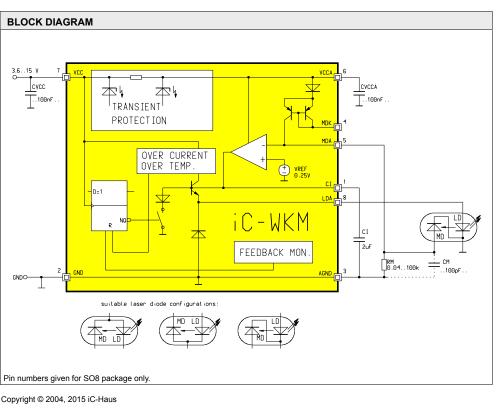

♦ Laser levels

Blue laser diodes

Bar-code readers

♦ Laser diode modules

Laser diode pointers

PACKAGING INFORMATION SO8-TP, DFN10 4 mm x 4 mm to JEDEC standard

#### **PIN CONFIGURATION SO8-TP**

#### PIN FUNCTIONS No. Name Function

- 1 CI Capacitor for Power Control
- 2 GND Ground
- 3 AGND Reference Ground for CI, RM
- 4 MDK Monitor Input 2
- (MD Cathode, modulation)
- 5 MDA APC Setup, Monitor Input 1 (MD Anode)
- 6 VCCA Driver Supply
- 7 VCC +3.6 to 15 V Supply Voltage
- 8 LDA Driver Output (LD Anode)

The *Thermal Pad* is to be connected to a Ground Plane on the PCB. Do not short-circuit pins AGND and GND, for this may deteriorate the precision of the regulator and interfere with the soft-start!

#### iC-WKM M-TYPE CW LASER DIODE DRIVER SAFETY INSTRUCTIONS Laser light can damage the human eye and the DANGE eyes of animals! Do not look at any laser light directly or through any optical lens. When handling a laser diode, do not look directly at the light generated LASER RADIATION by it. Wear appropriate safety glasses to prevent light DO NOT STARE INTO BEAM from entering the eye even by reflection. FUNCTION DESCRIPTION Setting the output power The output power is simply set by RM = V(MDA) / I(MD); with V(MDA) = Item-No. 101 and I(MD) = monitor current of the laser diode at the desired operating point. RM should be combined from fixed resistor (max. output power) and a trimmer (calibration). Turn-on behaviour 100mV After switching the supply voltage on, the output stage remains disabled until the internal enabling flip-flop is –100mV V(LDA) 1,5V set by a sufficiently high voltage at VCC. A quick soft start follows; the transition to controlled CW 1,0V 500mV operation is gradual and primarily determined by the values of CI and RM. CI is properly dimensioned when V(CI) the voltage overshoot at MDA is at a minimum. 2V 1V I(LD) 100m

#### Turn-off behaviour

iC-WKM works without a fixed undervoltage lockout, thus the laser diode forward voltage is the prime factor determining the lowest possible supply voltage.

If the voltage drops below this value, the output stage is forcibly saturated and the laser current decreases. iC-WKM simultaneously discharges the control capacitor CI so that no excessive laser diode currents occur when the supply voltage rises again.

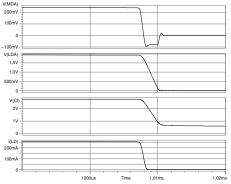

Figure 2: Turn-off behaviour

#### **Disruptions in operation**

The power control is shut down with excessive driver temperature or when the laser current reaches the overcurrent shutdown threshold, for example when the feedback is interrupted. If the monitor diode or the bias resistor RM fail, the device is shut down in less than  $600\,\mu\text{s},$  provided that the supply voltage applied is high enough.

When modulating the laser current via pin MDK, excessive voltage occurring at pin MDA also may cause a shutdown.

# iC-WKM M-TYPE CW LASER DIODE DRIVER Laser diode types In principle, all three laser diode types can be operated to the higher forward voltage. VCC \_ 🔺 L D 250m With P-type laser diodes it is also possible to connect GND Even N-type laser diodes can be operated by iC-WKM; To prevent instability of the regulator an additional ca-LD GND GND/ Figure 4: Operation of a P-type laser diode

vcc 250m' GND. GNF

Figure 5: Operation of an N-type laser diode

#### APPLICATION NOTES

by iC-WKM.

As iC-WKM has been optimised for use with M-type laser diodes, it is with this type of diode that the best functionality is achieved. This type of setup also enables the laser diode package to be connected to GND.

the laser diode package to GND. Here, however, the current mirror at MDK introduces a certain error to the automatic power control (c.f. Electrical Characteristics Nos. 108, 110).

iC-WKN, however, which has been optimised for use with these diodes, may be a better choice.

#### Layout

pacitor (ca. 100 pF) must be positioned directly at the iC's pin CI. Depending on the laser diode, capacitor CM with typ. 2 nF in parallel to RM may be required for stability.

Pin AGND acts solely as a ground reference for the power regulator (CI and RM) and should not be short-circuited with GND externally. This could have a negative effect on the control behavior and monitor functions.

#### Cooling

Laser diodes should be sufficiently cooled, particularly with the power-regulated operation of setups which use iC-WKM, for example. The power dissipation in the laser diode otherwise causes the diode to heat up and the level of efficiency to drop which the power control unit then compensates for by increasing the laser current. This in turn brings about a rise in power dissipation in the laser diode and thus also in temperature. In this instance the laser diode could be damaged (resulting in spottiness and an increase in operating current) or even destroyed before the overcurrent shutdown threshold in iC-WKM is reached. This applies in particular to blue laser diodes whose power dissipation is considerably
