¹ Each laser is provided with a test sheet defining the drive current and PPLN temperature to achieve CW operating power at a typical Necessel of 30°C. PPLN temperature must be optimized. The operating temperature may be decreased, however, the drive current must not exceed the test sheet value.

² Relative to the top of the cap. Row 2 is the row closer to the flex circuit.

³ Defined as the area of an aperture placed at the emitting face of the package that encompasses all beams.

⁴ Polarization is perpendicular to the plane of the two rows of emitters exiting the package.

⁵ IR leakage with window

⁶ Primary beam axis relative to surface normal of package base
