MTS2 SENS single gas

Thermal IR detectors for gas analysis

The thermo-electric IR detectors of the MTS series (Micro-Hybrid thermopile sensors) are characterized by a particularly high detectivity and longevity.

The base of each thermopile detector is formed by the so-called thermocouple. Due to thermal diffusion currents of two different metals (Seebeck effect), it generates an electrical voltage – the measurement signal. These serially connected thermocouples, called thermopiles, achieve a higher output voltage.

The sensitive component of Micro-Hybrid thermopile detectors is a MEMS-based thin-layer system on a silicon substrate. We offer sensor chips with either 80 (TS 80) thermocouples for non contact temperature measurement or 200 (TS 200) thermocouples for NDIR gas analysis. Depending on the application, both basic types are provided with different spectral absorber layers.

FEATURES

- Specialized to measure determined gases
- Different backfillings to adapt performance for chosen target gas
- Reference channel

APPLICATIONS

- **Medical technology:**
Anesthesia equipment, patient monitoring
- **Environmental engineering:**
Monitoring CH₄ in biogas plants
- **Laboratory technology / bioengineering:** Measurement of CO₂ and H₂O in cell and tissue growth, C₂H₅OH-detection
- **Industrial process control:**
Detecting SO₂, NO, CO and other process relevant gases
- **Safety technology / explosion protection:**CO₂-, CO-, CH₄-detection

BENEFITS

- **Excellent performance** due to best materials like BiSb / Sb for thermoelectrical effect
- Best detectivity
- High sensitivity
